

State at halt alone

CFSR = 0x00020000 (UFSR bit 1 = INVSTATE)

HFSR = 0x40000000 (FORCED)

ICSR & 0x1FF = 3 (VECTACTIVE = HardFault)

record.on_complete = 0x00000000

Fault type: legible.

Corrupted pointer's real value: not legible

(D-cache write-back masks it - see below).

Which instruction wrote it: not visible.

With instruction trace

main.c:38 Process() copy loop

main.c:40 (repeated)

main.c:42 Process() returns

main.c:58 record.on_complete(); <- fault here

Process() is directly implicated: it is the only code that ran between a known-good assignment and the faulting call.
